1	Sudan Projected Population (total) 2009 - 2020	5
2	Sudan Projected population by 5 age bands 2009 - 2020	6
3	States projected population summary (total 2009 – 2020)	9
4	Northern state projected population (2009 – 2020)	10
5	River Nile state projected population (2009 – 2020)	35
6	Red sea state projected population (2009 – 2020)	57
7	Kassala state projected population (2009 – 2020)	85
8	Gadarif state projected population (2009 – 2020)	122
9	Khartoum state projected population (2009 – 2020)	156
10	Gazira state projected population (2009 – 2020)	181
11	White Nile state projected population (2009 – 2020)	206
12	Sinnar state projected population (2009 – 2020)	234
13	Blue Nile state projected population (2009 – 2020)	259
14	North Kordofan state projected population (2009 – 2020)	281
15	West Kordofan state projected population (2009 – 2020)	309
16	South Kordofan state projected population (2009 – 2020)	349
17	North darfur state projected population (2009 – 2020)	399
18	Eastern darfur state projected population (2009 – 2020)	454
19	Central darfur state projected population (2009 – 2020)	479
20	Western darfur state projected population (2009 – 2020)	504
21	South darfur state projected population (2009 – 2020)	529

INTRODUCTION

Population censuses provide us with the population totals. Age-sex distribution, marital status, distribution as well as characteristics of population as enumerated on the census date. Generally, the censuses are conducted once in a decade. In a few countries, censuses are conducted once in five years, but in Sudan conducted every ten years 1973, 1983, 1993, and 2008 it was delayed at that time they need to sign peace agreement, also it should be conducted in 2018 but also postponed for the unstable situation.

However, in many situations, governments as well as non-governmental agencies require population totals or population in specific age-sex group for any time, either for the past dates or for any future date.

In this unit estimates of population in future will be apply and also the need or role of this estimate and method obtaining.

CONCEPT

Population projections means estimating or forecasting the population of country for given time the future type will used here

So population projection neither try to indicate the prospect of future population nor do they try to forecast or predict future population. Population projection simply indicates to us what will be the future population trends if the assumed levels of fertility, mortality and migration are realized. So population projections can cover any exercise of the form that what will be the population of SUDAN

Fertility remains constant at the present level or Fertility here drops suddenly to the replacement level NNR = 1. Whereas population prospects include population projection made under reasonable assumptions about alternate level of fertility, mortality and migration.

NEED AND USE OF POPULATION ESTIMATES

As we have seen in the introduction the data on population are available only for one date in a decade. But for many purposes such as the estimation of yearly series of crude birth rate, crude death rate, crude marriage, etc. estimates of population are required for every year. Since we estimate the vital rates for calendar years even for the census year we cannot use the census total but require the estimate of midyear population to use in different aspects

PLANNING

Population projections form an indispensable part of the statistical basis for socio-economic development planning and other government programs. In the process of planning it is necessary to know how the population will change, how Labor resources

will change, how the number of children of school-going Age will change, etc. Without these kind of data, it is impossible to determine correctly the plan indices of population, national income, distribution of commodities, etc. as well as the size of target group for various programs of education, public health etc.

POLICY MAKING

Population projection has been used in for in formulation population policy in action government about the consequences of the present trend in fertility, mortality and migration. In many instances, population projection has evoked concern about such continuation of demographic trends which have resulted in governments' action for moderating the trends in fertility, mortality or migration.

ANALYTICAL USES

Government and private agencies use of population projection in planning and policy-making whereas demographers use population projection mostly for analytical purposes. The main purposes to analyses the demographic and consequently, socio-economic consequences of alternative about future of alternative about different aspects also use as tool for checking consistency in the census age distribution and inter-censual vital rate, for studying the phenomenon of ageing, for estimating inter-censual vital rates, etc.

COMPONENT METHOD OF POPULATION PROJECTION

The mathematical method of projecting population provides an estimate of only the total population and these methods cannot give us distribution of population by sex and age. To obtain estimates of future population by sex and age, a component projection method is used it consists in separate projections of the various components of population growth, namely, births, deaths, and migration. It will be done separately for the various sub-group of the population it depends in a few terms

- Base year of the projection

This the year from which projection is started usually it is taken as the year of the last census 2008

- Projection Period

It is the period from the base year, for which projections are extended generally it is taken here for twelve years.

THE INPUT DATA USED FOR THE APPLICATION OF THIS METHOD

- The age sex distribution of the population in the base year, it is free from all type of errors it was evaluated during the census, used all Untied nation recommendations for census
- Mortality life table survival ratios in the year age-group for male and Female for the base year and estimates for each succeeding year intervals: in most cases, survival ratio are borrowed from the model life table. In such situations, the necessary input data are estimates of life exception at birth for males and Females for the base year.
- Fertility estimates of any of the fertility indicators like general fertility rates or age specific fertility rates for the base year and for each of the succeeding interval. Estimates of sex ratio at birth are also used.
- Migration estimates of either volume or rate of net-migration by age and sex for the base year and of the succeeding interval.
